<b>Specialities:</b> Dam (inform operator),		
<b>Gear:</b> Ropes: 2x45m		
<b>Summary:</b> (machine translated) Hike, swim, and rapel canyon below a reservoir		
<b>Hydrology:</b>		
<b>Access:</b> (machine translated) From Santiago de Compostela on the C543 to Noia (37 km), further north always along the sea on the C550 via Muros and Carnota to Ezaro (total 114 km). Just before Ezaro there is a bridge over the Rio Xallas. Directly after the bridge turn right and drive along the river to the Central Hidroelectrica (approx. 1.5 km). Park the (first) car here. With the second car - or on foot in about 60 min. - before reaching the Central H. turn left (northward) on the tarred road in serpentine steeply up to the viewpoint and from there further in northeastern direction to the dam (Presa de Santa Uxia). From here you can still descend in a southwesterly direction to the river (park the second vehicle here at the latest).		
<b>Approach:</b> (machine translated) From the second vehicle a few meters downstream, to the first long pool. Here entry.		
<b>Tour:</b> (machine translated) 4-6 rapel. To get in the mood, you should look at the final waterfall Cascada de Ézaro (50 m high) from the Central Hidroelectrica, when water is released from the reservoir - usually around noon for about 30 min. - and a cloud of water dust rises from the 16 m deep pool up to 40 m high. A call to the Central Hidroelectrica on site (Tel.: 981 712 703) could be unsuccessful, but at the head office (Tel.981 706 700) one gives willingly information, from which time one can enter the Xallas (with us from -'despues' 15:00 o'clock). The descent becomes after a walk and swimming distance up to the renewed rest water discharge in the sequence of deep pools in smooth granite rock increasingly more attractive up to the view of the close sea above at the final waterfall, which can be broken about half pleasantly on a paragraph. Before the final waterfall you can get off to the right.		
<b>Return:</b> (machine translated) After the last long rapel out to the right to Central Hidroelectrica.

Automatisch importiert von Descente-Canyon.com für Canyon Xallas Très belle descente, ensoleillée, avec une vue imprenable sur l'océan. Difficile de savoir quel est censé être le "débit correct", mais il semblerait que le niveau d'eau ait été "normal" pendant notre descente. Il est extrêmement important d'appeler, la veille ou le matin même de la descente, le numéro du barrage indiqué dans la fiche descriptive pour connaître les horaires des éventuels lâchers d'eau (les personnes au bout du fil répondent volontiers ; à noter qu'en cas de lâcher d'eau "normal", l'eau met apparemment 3h à arriver à la cascade finale, mais il faut se faire confirmer cette information). Il n'empêche qu'il y avait beaucoup d'eau, suffisamment pour former des mouvements en pied de cascade et pour rendre les "lèvres" des cascades difficilement franchissables à gué, ce qui pouvait rendre certaines transitions RG-RD assez complexes. Nous avons shunté le premier rappel (équipé RD) en desescaladant RG, puis tout descendu RG jusqu'à la grande cascade finale, que nous avons descendu en utilisant la ligne centrale (fractionnée).
